FICTIONAL TRAINING ARTIFACT — NOT FILED — NOT LEGAL ADVICE

Workbook cover and finance assumptions

Workbook reference RIF-2025-Q1 opened February 14, 2025. Sable Finch supplied an annualized payroll-savings target of $612,000. Draven Pike owned the operations decision; Mira Solis controlled versions and source links.

The covered population included 23 authorized operations and support positions: 21 were filled and 2 were vacant. Four occupants of filled audit-manager positions—Leora Benton, Tessa Wynn, Omar Ibarra, and Calvin Keene—were grouped because their duties included regulated-client audits, field-team assignment, and remediation review.

The model treated salary and recurring employer-paid benefits as savings. It excluded severance, any vacancy saving already removed from the baseline, and speculative future revenue. The two funded vacancies later listed in B-7 remained in the baseline. Higher evaluation scores favored retention but did not by themselves choose a savings scenario.

Covered-manager population and annualized cost

The February 14 baseline listed the four audit managers without a selection flag:

- Benton: senior compliance audit manager; annualized payroll cost $148,000;
- Wynn: audit manager, client transitions; cost $139,000;
- Ibarra: audit manager, multi-region field work; cost $132,000; and
- Keene: audit manager, automation support; cost $128,000.

All four reported through Naomi Voss for evaluation calibration and through operations for staffing. None occupied a distinct office scheduled for closure. The workbook therefore required criterion scoring and documented coverage analysis.

The remaining covered employees appear in the headcount ledger. Their costs contribute to the company-wide target but do not erase the within-manager comparison.

Imported scores — February 14 baseline

The read-only import applied the written weights. Benton received 27 completion, 22 continuity, 14 credentials, 12 availability, and 9 role-uniqueness points, totaling 84.

Wynn totaled 76: 24, 20, 12, 10, and 10. Ibarra totaled 73: 22, 18, 13, 9, and 11. Keene totaled 74: 25, 16, 11, 8, and 14.

The source column linked Benton’s completion score to a 94 percent timely-close rate and her availability score to twenty-eight completed travel days. Two Benton client transitions extended through June. The import showed no disciplinary deduction.

These values were inputs, not a selection. Later workbook versions changed scores through calibration entries rather than by refreshing the source systems.

Version 1 savings model and February 24 revision

Version 1 combined three filled support-position eliminations, two vacancies, and one manager position. With Benton selected it modeled $542,200, which was $69,800 below the target. A February 24 revision added the $76,200 vendor-coordination specialist, producing the seven-position B-7 scenario and $618,400 in annualized savings.

Finch marked $612,000 as a target, not an arithmetic formula demanding Benton. She asked the team to test combinations that maintained client coverage and produced at least $612,000.

The final nonmanager base was $470,400. Replacing Benton with Wynn yielded $609,400, Ibarra $602,400, or Keene $598,400. A separately modeled $14,600 archive-hosting expense consolidation made those alternatives $624,000, $617,000, and $613,000; it was an expense saving, not a position.

Calibration changes applied to Benton

On March 7, Benton's continuity score changed from 22 to 14. The note said her two June client transitions were “handoff capable,” but did not identify a different transition scale. Her availability score changed from 12 to 6 based on one declined short-notice assignment on December 19, despite twenty-eight completed travel days.

On March 14, role uniqueness changed from 9 to 7 because other managers could absorb remediation review. Completion and credentials remained 27 and 14. Benton's final total was 68.

Voss entered the continuity and availability changes; Pike approved them. Solis entered the uniqueness change after the final calibration meeting. Each edit preserved the imported value, but the justification fields did not cite a new source metric.

Retained-manager credits and exceptions

Wynn’s continuity score increased from 20 to 22 because leadership wanted one owner through the Lantern transition, scheduled to finish May 30. Her final total became 78.

Ibarra’s availability increased from 9 to 14 through a travel-volunteer exception. The cited email concerned willingness to travel during the coming quarter; his completed 2024 travel was sixteen days. His final total became 78.

Keene’s role-uniqueness score increased from 14 to 15 for maintaining an automation library. His final total became 75. No time estimate accompanied the assertion that the function could not be transferred within ninety days.

The workbook did not apply a comparable continuity exception to Benton’s June transitions or a completed-travel credit to her availability score.

Final scenario comparisons

Scenario B-7 selected five filled positions—Benton ($148,000), audit scheduling specialist ($94,600), controls documentation lead ($88,800), client onboarding analyst ($82,400), and vendor coordination specialist ($76,200)—and eliminated two vacancies: field auditor ($66,400) and project coordinator ($62,000). The seven amounts total $618,400.

Scenario C-4 retained Benton, selected Wynn, and paired the $609,400 position savings with the $14,600 archive-hosting consolidation for $624,000. Scenario D-2 paired Ibarra with that expense saving for $617,000, and E-3 paired Keene for $613,000. Operations rejected them for continuity, summer travel coverage, and automation support, respectively.

Thus more than one scenario met the numeric target. Pike chose B-7 on March 21 after considering the score changes and coverage labels.

Version log and final-selection record

The log lists creation on February 14, baseline lock on February 17, first savings model on February 18, calibration versions on March 4, 7, 10, and 14, finance confirmation on March 18, and Pike’s approval on March 21.

Version 2025-03-21-FINAL records Benton as selected and Wynn, Ibarra, and Keene as retained. It reports $618,400 projected savings and an April 1 effective payroll date. Solis certified that formulas reconciled to the headcount ledger.

The change log shows the changed values, timestamps, and approvers. Its criterion labels are cost, redundancy, weighted score, and coverage. It contains no protected-activity scoring field and no entry stating that Benton's January opposition or February charge supplied a criterion.
