

**SYNTHETIC TRAINING RECORD — FICTIONAL PARTIES, PEOPLE,
AGENCIES, SYSTEMS, IDENTIFIERS, AND EVENTS — NOT A REAL
FILING OR CYBERSECURITY GUIDE**

Declaration of Cyber Operations Records Custodian

Filed: August 4, 2025 **Synthetic docket:** SYN-DMD-25-CV-0914

I, Kira Morrow, am the fictional records custodian for the Grid Sentinel exercise collection maintained by the fictional DOE Office of Resilience Exercise Records. My assigned role is to identify authoritative editions, explain their administrative purpose, and distinguish final records from drafts and duplicates. I do not hold a real government position.

I reviewed the twelve records associated with request DOE-FOIA-2024-OG-041 and the category descriptions prepared for litigation. Grid Sentinel is an invented set of paper-like policy records. It is not software, does not connect to infrastructure, and contains no executable command. Any term that resembles an operational concept is used at an abstract level, and the sealed values are harmless labels created only for this case.

My declaration addresses why the records were compiled, how their families relate, what makes particular fields sensitive within the assigned hypothetical, and why current and superseded copies were preserved. I do not offer an opinion about the ultimate legal sufficiency of a FOIA withholding. That judgment belongs to the Court applying the statute to the evidence.

Grid Sentinel Record Families

The Operational Decision Tree organizes high-level choices after a fictional indicator has already been presented to an authorized exercise participant. Its pages use abstract condition boxes, review gates, role references, and closure states. It contains neither monitoring instructions nor a method for obtaining an indicator. The responsive set includes current, superseded, exercise, and quality-review editions.

The Cyber-Incident Escalation Matrix associates abstract classifications with fictional coordination levels. It does not list a real facility or person. The Response-Coordination Appendix describes how invented organizational roles document and communicate an exercise decision. Governance records establish approval, effective date, and supersession without containing the decision structure itself.

Version 3.7 became effective September 19, 2022. A final tabletop edition labeled T1 was approved November 6, 2023. Version 4.2 became effective February 12, 2024. A separate quality-review map was finalized March 4, 2024. Those dates fall within the clarified period.

The families share defined terms, but they are distinct records. A title or revision block can be administrative even when adjacent material has an assigned operational meaning. Reviewers considered that distinction during processing.

Compilation and Law-Enforcement Purpose

The playbooks were created and later used to support prevention of, and coordinated response to, unlawful attacks within the fictional program. Their assigned purpose includes maintaining safety and preserving orderly decision-making during an exercise. They are not collected merely because ORER stores records or because DOE is a government agency.

Program personnel approved each final edition after a document-control review. An approved tree or matrix was then placed in Beacon. When replaced, the earlier copy moved to Driftglass with its supersession metadata intact. Harborline retained final approval and distribution instruments. The same record could therefore be located by content in one repository and referenced administratively in another.

The operational families were compiled for use by protective and coordinating roles. Governance records were compiled to document approval. That difference explains why ORER released the two governance records in full while applying Exemption 7 to portions of the playbooks.

No declaration fact depends on a genuine enforcement technique. The exercise assumes that disclosure of the invented framework could allow a hypothetical actor to anticipate decisions. My statements describe that assumed function without teaching a reader any real prevention or response method.

Decision-Tree Content and 7(E)

The current decision tree, GS-DT-4.2, contains eighteen source pages. Within the hypothetical, its nonpublic character lies in the relationship among a fictional decision condition, the order of review, and the branch selected after an authorized role records a result.

Public familiarity with the idea of triage does not reveal how this particular invented edition organizes its conditions. For that reason, ORER treated the detailed arrangement as a technique or procedure. It also treated certain policy-like fields as guidelines where exposing the value or branch would let a reader infer when the framework changes course.

The sealed excerpt replaces public redaction notices with inert terms such as Condition-Aster and Sequence-Beryl. Those terms have no external meaning and encode no threshold. They show only that two distinct field types occupy corresponding places. A user cannot apply them to a machine, network, or actual incident.

In my assessment, disclosure of the assigned relationships would reduce the effectiveness of the hypothetical framework by allowing its order to be anticipated. Administrative revision language does not necessarily create that harm and was separately reviewed.

Escalation, Coordination, and 7(F)

The escalation matrices and coordination appendices include fictional duty-role, contact-channel, safety-reference, and escalation-position fields. ORER assigned those fields to 7(F) when their context associated them with people carrying out a protective function. Some of the same fields also reveal how a decision proceeds and therefore carry a 7(E) notation.

I did not provide a real name, route, place, schedule, or contact. The sealed materials use Role-Dovetail, Channel-Fable, Safety-Echo, and Value-Cinder as nonfunctional markers. The public versions display explanatory redaction tokens. These paired treatments preserve what type of information was reviewed without creating a usable operational artifact.

My initial harm assessment grouped similar fields across records. I concluded that revealing them could facilitate interference with fictional responders or attention to a safety-related function. The public index describes the category rather than a different causal scenario for every field. The category was applied after inspecting the responsive documents, not by searching for a single word.

I understand that Open Grid disputes whether the category explanation is sufficiently particular and whether a neutral heading shares the same protection. My declaration reports the custodian judgment; it does not resolve that legal dispute.

Exact Responsive Inventory

The four decision records are GS-DT-4.2, eighteen pages; GS-DT-3.7, sixteen pages; GS-DT-T1, fourteen pages; and GS-DT-QA, twelve pages. Their subtotal is sixty. The first two were withheld in full, while the exercise and quality-review editions were partially released.

The three matrix records are GS-EM-4.2, twenty pages; GS-EM-3.7, eighteen pages; and GS-EM-T1, sixteen pages. Their subtotal is fifty-four. The current matrix was withheld in full; the two earlier or exercise matrices were partially released.

The coordination records are GS-CA-4.2, twenty-four pages; GS-CA-3.7, twenty-two pages; and GS-CA-T1, eighteen pages. Their subtotal is sixty-four, and each was partially released.

Governance memorandum GS-GV-04 has twelve pages, while supersession and distribution log GS-GV-03 has ten. Both were released in full.

Adding sixty decision-tree pages, fifty-four matrix pages, sixty-four appendix pages, and twenty-two governance pages yields 200. The three fully withheld records total fifty-four; the seven partial records total 124; the two full releases total twenty-two. I verified each length against the authoritative copy.

Version Comparison and Segregability

Current and superseded records can remain sensitive within the assigned facts because comparing them may reveal which fictional condition, sequence, or role relationship changed. That observation does not mean an older page is automatically exempt. Reviewers evaluated whether the relevant relationship remained discernible and whether a nonoperational portion could be extracted.

The records contain administrative elements. A revision block may identify approval and effective date; a heading may name a general function; an instruction may concern document ownership rather than response action. I asked reviewers to distinguish those elements from condition values and branch relationships. Several administrative passages were released in the partial records, while others were retained where the team believed surrounding context supplied protected meaning.

For the three records withheld in full, I concluded during initial review that the organization was continuous enough that isolated fragments would either lack meaning or reveal structure. That conclusion was recorded at the document and page level, not as a prose explanation for each line.

My August 2024 review also left a traceable worksheet for any renewed assessment required in this action. The preserved notes identify the record, page, asserted field type, and disposition existing at that time. They do not predetermine whether another reviewer could separate additional administrative wording after considering a more specific challenge.

Authentication and Declaration

I compared the public and sealed counterparts of the primary index prepared with this declaration. Corresponding pages address the same record groups and asserted field categories. Public pages contain visible notices where the controlled copy uses inert exercise labels, and both counterparts contain nine logical pages. My comparison does not add a source record to the responsive universe.

Stable logical references may point to a corresponding segment without requiring an unauthorized viewer to know or open a sealed physical page. That access feature is administrative and does not affect my substantive description of the underlying record. I did not use a stable reference to conceal a difference in record count or page arithmetic.

All system names, edition values, people, roles, and repositories are fabricated. The text omits actionable instructions and cannot be used to operate or defend a real network. I reviewed this declaration for consistency with the record schedule and the FOIA officer's accounting.

I declare under penalty of perjury that the foregoing is true and correct within the synthetic exercise. Executed August 4, 2025.
