AGENCIES, SYSTEMS, IDENTIFIERS, AND EVENTS — NOT A REAL
FILING OR CYBERSECURITY GUIDE**

Sealed Response-Coordination Playbook Appendix

Filed: September 8, 2025 **Synthetic docket:** SYN-DMD-25-CV-0914 **Access:** Sealed exercise counterpart

This seven-part controlled exhibit uses harmless invented nouns to show the placement of fields discussed in the public Response-Coordination Appendix. It is not an original operational manual and does not reproduce one. Role-Dovetail, Safety-Echo, and Channel-Fable are arbitrary labels with no referent outside this synthetic record.

The exercise appendix concerns custody of approved documents, recording of review activity, and preservation of superseded editions. It never supplies executable logic or a method for interacting with any environment. The controlled words merely permit an authorized reader to distinguish three semantic field types that DOE grouped under its Exemption 7(F) theory.

Each page corresponds in subject and offset to the public counterpart, although the prose has been written independently. The public notice for a duty category aligns with Role-Dovetail; the notice for a safety category aligns with Safety-Echo; and the notice for a communication category aligns with Channel-Fable. None of those substitutions encodes a person, address, mechanism, or interval.

Sealed access is requested because DOE wishes to present its asserted functional relationships without placing even fabricated controlled labels on the open docket. That litigation choice does not convert the labels into actionable information or decide whether broader closure is justified.

Custody, Approval, and Administrative Text

ORER is identified as the fictional keeper of the approved exercise appendix. Its record office maintains a cover entry for the edition, a notation showing when approval occurred, and a reference to the edition that ceased to be current. A publication review is assigned to Role-Dovetail, an inert designation used only in this exhibit.

The administrative entry also shows that Channel-Fable was selected as the dummy distribution class. Channel-Fable is not an address, medium, route, or access point. It simply marks the location where the underlying litigation description says a communication category appeared.

The remaining sentences deal with documentary housekeeping. An approved version is distinguished from a working draft; a retired version remains available to records personnel; and receipt of the current edition is entered in the publication history. These propositions are comprehensible without either controlled label and reveal nothing about responding to an event.

For correspondence purposes, this is the second semantic division of both copies. Its public partner contains descriptive withholding tokens at the locations occupied here by Role-Dovetail and Channel-Fable. The pairing allows a reviewing court to assess whether neutral administrative matter could stand alone while preserving DOE's claimed field categories during the review.

Controlled Coordination Categories

The fictional appendix organizes documentation around four broad states: a matter is logged, considered, recorded, and archived. These words describe the history of an exercise file. They do not dictate any technical action and are not tied to a real occurrence.

Role-Dovetail appears beside the abstract ownership field used during review. The label supplies no occupational title or assignment; its only function is to mark the field's semantic position. Channel-Fable appears beside a classification for documenting that a review entry was circulated. It likewise contains no contact detail.

The controlled text clarifies that an exercise discussion is not itself a final administrative decision. A separate approval notation closes the publication question and becomes part of the edition's history. This internal distinction explains the document's governance purpose without identifying an operational condition or response.

DOE uses the field relationship to support a general human-function concern. Open Grid disputes the breadth of that inference and argues that the neutral framework can be separated. This exhibit preserves the controlled presentation for adjudication; it does not state that either side's legal position is correct.

Nothing in this division reveals an order in which protective measures occur. The sequence of four archival states is ordinary file administration and cannot direct conduct in a live setting.

Stewardship Transfer Notations

When responsibility for an exercise publication moves, the fictional appendix calls for a stewardship record. That record contains a calendar date, an edition reference, a statement that related exercise papers were or were not included, and an acknowledgment by the receiving records office.

Role-Dovetail marks the controlled assignment category associated with that record. Channel-Fable marks a fabricated communication classification. Because both labels are inert, they reveal neither who acted nor how any information moved. The surrounding description remains administrative.

The transfer notation also separates unresolved editorial questions from completed changes. A pending question returns to the publication custodian; an approved change enters the revision history. Neither path includes a system instruction, incident criterion, or real deadline. The distinction exists so a later custodian can reconstruct the status of a document.

An authorized reader may compare this page to its public counterpart and observe that the public notices occupy equivalent semantic positions. The two versions do not share substantive phrasing. Correspondence is based on topic, not on a reversible redaction scheme.

The source request excluded actual incident forms, live contact rosters, telemetry, configurations, and credentials. No excluded category has been inserted here under a fictional name. The controlled words indicate only types asserted in litigation.

Human-Function Classification

A general safety sentence asks exercise participants to document a concern consistently with existing fictional policy. It purposely stops at that proposition. Safety-Echo marks the type of safety reference that DOE says appeared in the sample; Role-Dovetail marks the associated assignment type.

Neither label describes a threat, protected person, facility, precaution, or response. They have no ordinal meaning and no relationship to a real threshold. Their juxtaposition shows only why DOE grouped the segment as a human-function category when preparing its sealed explanation.

The appendix differentiates a safety-coded administrative referral from an ordinary publication inquiry so that custodians can file the resulting exercise note appropriately. That differentiation is about the classification of records after a fictional referral. It offers no instruction for recognizing or addressing an event.

DOE contends that revealing the actual category relationship could interfere with protective functions. Open Grid contends that the agency must connect a meaningful category to an expected safety harm and still segregate neutral text. This controlled exhibit supplies the location of the asserted relationship but expresses no conclusion on the competing legal arguments.

Because the labels were invented for this case, disclosure to an authorized reviewer cannot expose a real practice. Continued sealing is a procedural feature of the exercise record only.

Edition Distribution Record

The appendix's publication section requires recipients of an approved exercise edition to acknowledge the document title and revision. The records office preserves those acknowledgments and notes when a supersession message has been issued. A historical master remains in the archive after ordinary copies are marked obsolete.

Channel-Fable occupies the field for the controlled communication classification. Role-Dovetail occupies the field for the reconciliation assignment. These are nonfunctional labels: they neither identify a route nor indicate a real human role. They exist so the sealed copy can demonstrate field placement without supplying protected content.

A reader can understand the visible policy independently. Revision discipline prevents a later reviewer from confusing a current approved edition with a superseded one. Recording receipt supports the accuracy of the publication history. Retaining the archival master preserves the basis for future records review.

No part of this section says how an operational alert travels or how a responder behaves. It addresses the circulation of documents within a fictional exercise program. DOE's exemption claim concerns the categories represented by the labels, while the general recordkeeping obligations are capable of separate public expression.

Controlled Segregation Worksheet

The reviewer examined the appendix sentence by sentence. Publication facts, revision language, neutral status words, retention duties, and approval descriptions were marked as independently meaningful. Segments containing Role-Dovetail, Safety-Echo, or Channel-Fable received a second review for whether removal of the label left readable administrative context.

Where context survived, the public counterpart retained a rephrased sentence and inserted the applicable notice at the corresponding semantic location. Where DOE believed the relationship itself carried protected meaning, the public account described the category more generally. The worksheet did not treat the mere presence of a label as requiring suppression of an entire page.

The matching seven-page structure permits comparison without exposing the controlled document through the public copy. It does not mean the words are aligned line for line. Independent expression prevents the public prose from operating as a cipher for this version.

The review identifies no command, address, technical mechanism, infrastructure feature, or response schedule. It deals solely with abstract classifications and document administration. An authorized court may use the worksheet to evaluate the claimed categories and the adequacy of segregation, but the exhibit does not predetermine that evaluation.
