

# Family corroboration, employment, and authentication packet

## Component index

This twelve-page packet collects distinct contemporaneous sources supporting chronology and foundation without duplicating the declarations: employment status and duties; the invoice, export, and correction logs; compliance and civic-integrity routing; clinic and photograph manifests; message metadata and transfer chain; and Nadia Pel's narrow authentication statement.

Codes preserve evidentiary relationships without using a full name, address, government registration number, or unnecessary personal identifier.

## Municipal employment-status extract

Employer: Orin Vale Municipal Records Office. Employee identifier: ARM-RX-14, linked only to A.R.M.'s initials. Employment period: February 2019 through approved leave beginning May 22, 2023; administrative separation recorded August 31 after departure.

Position: procurement-records clerk, records annex. Access class: read and audit-export for closed procurement packets; no authority to approve invoices, modify vendor permits, change receiving entries, or issue security flags.

The change log shows that Unit Four regional command requested the employment code and access history on May 16. On June 10 the personnel index received note RC-4 / regional inquiry open. The extract does not state the inquiry's merits or authorize detention.

Custodian OV-REC-2 certifies that the displayed fields match the archived personnel view as of August 31. The extract corroborates job access and flag timing, not A.R.M.'s account of what occurred in custody.

# Records-annex duty matrix

The duty matrix assigns A.R.M. these routine tasks: confirm packet completeness, scan signed pages, compare vendor and purchase-order fields, retrieve archived versions, and generate watermarked audit exports for internal compliance review.

It assigns supervisors the power to reopen a packet or correct a classification. It assigns procurement analysts the power to group invoices. It assigns compliance officers the power to create referrals. Unit Four has no ordinary invoice-approval role but may request access histories through a documented security inquiry.

The audit-export function automatically records employee code, document list, date, time, and destination queue. It does not permit deletion of the original. A.R.M.'s April 18 export therefore could be traced without assuming a stolen document.

The matrix was effective January through December 2023. It supports A.R.M.'s opportunity to see the packets and the distinction between copying through an authorized tool and altering an invoice.

# North Quay Lamps invoice register

The register lists six Harbor League invoices for one maintenance cycle:

- NQL-3101, NQL-3102, and NQL-3103, entered April 6;
- NQL-3104, NQL-3105, and NQL-3106, entered April 7.

Each invoice falls below the 25,000-unit secondary-review threshold. The six together total 137,400 units. All identify vendor permit HL - 47, inspection initials DV, adjacent street segments, and work dates within the same four-day period.

The first register version groups the invoices under maintenance cycle NQ - APR - A. A corrected version removes that group and labels each an urgent standalone repair. The register does not prove why the classification changed or that any person committed misconduct. It supplies the pattern A.R.M. reported and the nonpublic nickname later used in the threat.

# Audit-export and correction-history log

At 16:42 on April 18, access code ARM-RX-14 used the authorized audit-export function for the six invoice faces, group-link history, and vendor-permit entry. Destination queue: municipal compliance sealed review. Export result: nine pages; no source modification.

The correction log records analyst grouping at 09:16 on April 5, supervisor removal at 11:03 on April 6, and urgent-repair labels added between 11:11 and 11:19. Reason field: “operational continuity.” No supporting emergency report is linked in this extract.

On May 16, Unit Four request UF-RQ-88 retrieved the employment code and export manifest. The request did not retrieve the sealed page images. On May 20, a service-building terminal accessed the manifest again.

These entries corroborate timing and official access. They do not identify which officer saw the underlying pages or establish the lawfulness of any invoice.

# Compliance referral receipt

Referral CIV-23-184 opened May 2 at 10:24 by compliance officer Nadia Pel. Subject: possible invoice splitting and correction-history review. Source list: six invoice faces, group-link history, vendor permit, and audit-export manifest.

Original route: IND-REV, independent procurement review. On May 17 at 15:08, supervisor code COMP-S4 changed the route to SEC-CONSULT and linked Unit Four request UF-RQ-88. Pel's May 18 message to A.R.M.—“Do not delete your receipt. Routing changed.”—matches the audit time.

The receipt contains no conclusion that the invoices were improper. It establishes that A.R.M. used an internal channel, Pel created a referral, and an official supervisor linked it to the security inquiry before the May 19 detention.

The privacy protocol omits a street address and displays only the custodian and referral codes. Pel's authentication appears at the end of this packet.

# Civic-integrity receipt and routing audit

Complaint OCI - 23 - 441 was accepted June 7 at 11:32. Intake topics: two-night Unit Four detention, procurement questioning, physical injury, threat to a family member, and request for an independent investigator. Witness offered: S.M. Initial route: IC - 2, independent conduct review.

On June 9, central screen code OCI-S9 linked the complaint to CIV - 23 - 184 through employment code ARM - RX - 14. On June 10, the routing engine changed the destination to RC - 4, Unit Four regional command, reason “operational-security nexus.” No independent interview, medical-record request, or witness contact appears before transfer.

The audit ends June 30 with status “regional response pending.” It does not show a merits decision or protection plan. The sequence supports notice and routing; it does not establish what every official knew outside the logged fields.

# Clinic visit-source extract

North Bell neighborhood clinic registered an initials-only patient at 14:20 on May 21. Presenting history: “reported assault during two-day absence.” Observations: limited left-shoulder elevation, right-ankle swelling, rib tenderness, hoarse voice, and no observed loss of orientation.

Care recorded: shoulder sling, anti-inflammatory medication, hydration instruction, and return precautions for breathing difficulty or increased swelling. The clinician did not identify an assailant, conduct a forensic causation evaluation, or record the procurement dispute.

The visit copy was collected by S.M. at checkout and stored with the family notebook. Clinic custodian NB-3 confirms the fields and time. A trauma evaluator may consider the extract but must state that it is a limited contemporaneous clinical record.

The extract corroborates condition soon after release; it does not independently prove where or how each injury occurred.

# Family photograph manifest

The family tablet created eight images between 11:06 and 11:14 on May 21. The manifest describes, without reproducing sensitive likenesses: right-ankle swelling; left-shoulder range limitation; two views of rib-area bruising; wrist redness; clothing condition; and two full-scene images showing the shop-clock display.

Original filenames run FAM-2101 through FAM-2108. Device metadata reports local time and no editing application. Counsel made read-only copies on April 8, 2024 and computed hashes listed in the source-image archive. This packet uses a descriptive manifest instead of reproducing a face or body image.

S.M. states that S.M. took the images with A.R.M.'s permission. The manifest supports timing and observable condition, not medical diagnosis or identification of a person who caused the marks.

# Threat-message metadata table

The family account received five relevant messages:

- July 13, 08:22 — “The North Quay Lamps file is still open.”
- August 9, 19:04 — asks when “the annex clerk” will return.
- August 17, 06:41 — displays correction-log time 16 : 42.
- August 28, 22:10 — says the regional inquiry follows the employment code.
- September 2, 12:33 — asks whether family will collect A.R.M.'s work box.

Sender handles were newly created and cannot be attributed from the account data. Each message was exported with timestamp, handle, text, and attachment indicator. No attachment was opened.

The nonpublic nickname and correction time may support an inference of access when combined with other evidence. The table does not label the sender as Harbor League, Unit Four, or any official.

# Device and notebook transfer log

S.M. retained the paper family notebook and tablet until counsel's April 8 collection. Counsel photographed full notebook leaves, exported original message files, copied the clinic receipt, and created a read-only evidence directory. Each transfer entry identifies source device, operator code, start and end time, item count, and resulting hash.

The notebook contains entries unrelated to the case. Only relevant full leaves were copied, with margins visible so an edit cannot be hidden by a cropped line. Counsel did not erase corrected words; the source shows S.M.'s single-line corrections.

Device time was automatically set to Kalyrian local time during 2023. Counsel converted no source timestamp in the exhibit. Preservation-copy metadata created on April 8 is distinct from the underlying event times.

This chain supports authentication and exposes limits. It does not claim a formal forensic certification.

# Nadia Pel authentication statement

I, Nadia Pel, state that I was an Orin Vale municipal compliance officer in 2023. I created referral CIV-23-184 on May 2 from the nine-page export A.R.M. provided through the authorized compliance queue. I saw the original IND-REV route and the May 17 change linking the referral to Unit Four request UF-RQ-88.

I warned supervisors that routing complaints against Unit Four to Unit Four regional command created retaliation risk. On June 15 I told A.R.M. and S.M. that RC-4 meant that regional command. I was removed from the referral queue and cannot testify about actions after removal.

I authenticate the employment fields, referral receipt, and routing-code meanings in this packet. I do not claim firsthand knowledge of A.R.M.'s detention, July threat, or future treatment. I sign this statement as a component of the family packet; it is not Exhibit P-7.

# Packet certification and evidentiary map

Counsel certifies that the eleven preceding components are the sources described in the April 12 filing manifest and that the packet contains twelve pages.

The components support distinct propositions: employment access (pages 1–2); invoice pattern and export timing (pages 3–4); compliance referral (page 5); complaint notice and routing (page 6); post-release condition (pages 7–8); threat-message timing and source limits (page 9); chain of custody (page 10); Pel's authentication and limits (page 11); and this map (page 12).

This packet does not include A.R.M.'s separate P-7 declaration. It contains no event or source created after the April 12 filing date.

Counsel signs through the service code used on the application and certifies delivery to DHS actor code DHS-TC-7 on April 12, 2024.
