

Common rubric and evaluation window

The scorecards use 2024 source data and the February–March 2025 RIF calibration. The weighted maximum is one hundred: completion 30, continuity 25, credentials 15, availability 15, and role uniqueness 15. Higher values favor retention.

All four managers supervised regulated-client audits, assigned field staff, reviewed remediation plans, and reported to Naomi Voss for calibration. Specialized work could affect a criterion but did not remove an employee from the comparison group.

Each card displays imported and final values beside its cited source or exception. A cross-score audit records whether a changed field names a source, an exception, or neither.

Leora Benton scorecard

Benton's imported values were completion 27, continuity 22, credentials 14, availability 12, and uniqueness 9, for 84. Her final values were 27, 14, 14, 6, and 7, for 68.

The completion source showed forty-seven of fifty audits closed on time. Credentials included active certified internal auditor and regulatory-controls certificates. Travel records showed twenty-eight completed days in 2024 and one declined December assignment with less than twenty-four hours' notice.

Northline and Oriole transitions were scheduled through June. Calibration labeled them handoff capable. The March 20 B-7 coverage plan proposed that Keene could assume Benton's remediation- review queue if Benton were selected.

Tessa Wynn scorecard

Wynn's imported values were 24 completion, 20 continuity, 12 credentials, 10 availability, and 10 uniqueness, totaling 76. Her final continuity value increased to 22, producing 78.

Wynn closed thirty-eight of forty-three audits on time. Her Lantern transition was scheduled to end May 30. The exception note said changing the named manager before completion could concern the client, but the record contains no client request that Wynn remain.

Wynn completed nineteen travel days. She shared engagement-planning, field-assignment, and remediation duties with Benton. The card records no discipline and no employee-relations flag. The continuity exception was approved March 10.

Omar Ibarra scorecard

Ibarra's imported values were 22 completion, 18 continuity, 13 credentials, 9 availability, and 11 uniqueness, totaling 73. Calibration increased availability to 14, yielding a final 78.

The audit tracker showed thirty-five of forty-two matters timely closed. Travel history showed sixteen completed days. A February 27 message offering to take additional second-quarter travel supported the five-point exception.

Ibarra managed western-region field teams but used the same scheduling system and reviewer pool as Benton. He held one credential Benton did not and lacked one that she held. His scorecard contains no comparison between promised future travel and Benton's completed travel record.

Calvin Keene scorecard

Keene's imported values were 25 completion, 16 continuity, 11 credentials, 8 availability, and 14 uniqueness, totaling 74. His final uniqueness value increased to 15, for a total of 75.

Keene maintained scripts that assembled sampling reports. The automation library was documented, but no succession estimate or access restriction showed that another manager could not learn it within ninety days. The March 20 B-7 plan proposed adding Benton's remediation-review queue to Keene's work while preserving his automation assignment.

Keene closed forty audits, thirty-six on time, and traveled fourteen days. His March 14 exception was labeled automation uniqueness; the card records no separate client-relationship exception.

Duty-overlap comparison

The role matrix assigns all four managers responsibility for engagement planning, field-team assignment, exception review, remediation follow-up, and client status calls. Benton and Wynn both managed transition plans. Benton and Keene both reviewed control-testing templates. Benton and Ibarra both covered multi-region work.

Differences were matters of degree: Wynn had Lantern transition ownership, Ibarra coordinated western travel, Keene maintained automation scripts, and Benton chaired remediation quality review. The B-7 coverage plan proposed distributing Benton's functions among those managers and Voss rather than marking an entire function for discontinuance.

The matrix records the shared functions and the employee-specific assignments in separate columns.

Client-continuity comparison

Benton's Northline and Oriole transitions ran to June 18 and June 27. Wynn's Lantern transition ran to May 30. The imported cards credited all three matters, but calibration reduced Benton from 22 to 14 while increasing Wynn from 20 to 22.

The written scale awarded more credit for disruption extending farther beyond the planned April effective date. No recorded amendment reversed that scale. The calibration note instead called Benton's matters handoff capable and Wynn's relationship sensitive.

The March 20 B-7 transition plan proposed assigning Northline to Wynn and Oriole to Ibarra. The plan lists proposed assignees but contains no completed handoff or post-termination client result.

Availability and travel comparison

Benton completed twenty-eight travel days in 2024, Wynn nineteen, Ibarra sixteen, and Keene fourteen. Benton declined one December assignment offered with less than a day's notice because she was already scheduled for a client closeout.

The imported availability values were Benton 12, Wynn 10, Ibarra 9, and Keene 8. Final values were Benton 6, Wynn 10, Ibarra 14, and Keene 8. Ibarra's increase reflected stated willingness for future travel; Benton's decrease treated the single decline as a reliability concern.

No card records Benton refusing ordinary scheduled travel. The final comparison therefore rests on different kinds of evidence for Benton and Ibarra.

Cross-score audit and unresolved variances

Solis's March 18 audit reconciled arithmetic but flagged three policy variances: inconsistent treatment of transition end dates, future willingness compared with completed travel, and an automation exception without a transfer-time estimate.

The audit also noted that Benton's 68 final score resulted from three downward adjustments while each retained comparator received no downward adjustment and at least one preserved or increased credit. It requested Pike's confirmation that coverage needs justified the pattern.

Pike initialed the audit "approved—business continuity" on March 21. The notation does not break out each variance or add a source citation to any of the three flagged fields.
