

Rusk Camera Frame Sequence and Time Map

Source: Certified Rusk body-camera working copy **Prepared:** November 21, 2025 **Coverage:** 19:52:14 through 19:53:37 on February 3, 2025

This fictional demonstrative maps selected frame times to neutral visual descriptions. It does not replace the recording or certified transcript. The selections identify changes in camera field, not moments chosen to prove one witness's account. Each panel in the rendered exhibit consists of an authored frame description, time stamp, and visibility key rather than a photograph of a real person.

The working copy was decoded at its native frame rate. Display times were reconciled to the evidence-system time field without changing sequence order. Analysts marked a body part "visible" only when its location could be identified for that frame. A hand hidden behind clothing, another body, a rail, the frame boundary, or motion blur was marked "not reliably visible." That term does not mean the hand was stationary or engaged in a particular act.

The central finding is descriptive: Rusk's camera has a material obstruction beginning at 19:53:08 and ending at 19:53:22. During that span, the frames cannot resolve whether Ellison struck Rusk's forearm, reached toward his duty belt, or only recoiled and pulled from his wrist hold. Audio is treated in a separate synchronized exhibit.

Sequence A — arrival and approach

A-1, 19:52:14: Vehicle-door edge, parking lane, and Building C entrance are visible. Rusk's hands are away from the lens. No subject is yet in frame.

A-2, 19:52:31: Vega's vehicle appears behind Rusk. Iris stands at the lot edge and gestures toward the upper walkway. The frame does not show Mara Ellison.

A-3, 19:52:43: Rusk ascends. The rail occupies the lower-right area, and a vertical support divides part of the upper view. These fixed elements later combine with close bodies to narrow sightlines.

A-4, 19:52:48: Ellison is seated near C-12. Both hands are visible, open or relaxed, with no object held. A phone and keys are on the concrete nearby.

A-5, 19:52:53: Rusk remains several feet away. Ellison's hands stay near her knees. The breezeway opening and stair side are visible; no bystander is immediately beside her.

A-6, 19:52:57: Ellison turns her head toward the open walkway. Head direction alone does not establish an intent to flee. The panel contains no annotation assigning mental state.

Sequence A confirms the noncriminal approach and initially empty hands. It does not predict what later movement occurred or establish that safety conditions could never change.

Sequence B — final visible seconds before restraint

B-1, 19:52:59: Ellison remains seated. Rusk is closer than in A-5. The lower part of his sleeve begins entering the frame.

B-2, 19:53:01: Ellison shifts her weight. One hand remains visible; the other is partially affected by perspective near her torso. No frame shows a weapon.

B-3, 19:53:02: Rusk's arm extends and his hand makes contact with Ellison's left wrist. This panel marks the conceded beginning of physical restraint and the seizure.

B-4, 19:53:03: The left wrist remains within Rusk's grasp. Ellison's torso has begun turning. Her mouth is open while the transcript records "Don't grab me."

B-5, 19:53:05: Ellison's restrained arm moves toward her body. The free hand is briefly separated from the camera-facing equipment edge, but Rusk's arm increasingly occludes the view.

B-6, 19:53:07: Both bodies occupy most of the image. Shoes and the rail indicate rotation in a confined area. A single frame cannot determine force direction or whether the motion is voluntary recoil, resistance, or mutual repositioning.

Sequence B permits a chronology of grasp and turn. It does not visibly show a punch, a completed reach to equipment, or flight. The last clear frame cannot be extended into the later blocked interval.

Sequence C — obstruction onset

C-1, 19:53:08.000: Rusk's sleeve and Ellison's coat cover the center. The vertical support and rail occupy the right portion. Neither of Ellison's hands can be reliably located. This time starts the certified critical obstruction.

C-2, 19:53:09.500: A small patch of Ellison's coat and Rusk's forearm shifts across the image. Motion blur prevents identification of a separate hand contour.

C-3, 19:53:11.000: The image remains blocked while the transcript records Rusk saying "stop pulling" and Ellison saying "you're hurting me." The frame supplies no visual direction for the pulling.

C-4, 19:53:12.250: A portion of the concrete and lower rail is visible. A hand cannot be distinguished. The contemporaneous dull sound has no visible source.

C-5, 19:53:14.000: Coat fabric and Rusk's arm fill most of the field. The frame cannot show whether any hand contacted his forearm or moved near the belt.

C-6, 19:53:15.750: The camera pitches downward. No device contact point is yet visible. Rusk's short phrase has no identifiable visual referent.

Every C panel receives the same visibility notation: critical hands unresolved. None is annotated with "strike," "reach," "recoil," or "threat."

Sequence D — device cycle and descent

D-1, 19:53:16.000: The electrical cycle begins on audio. The image contains overlapping bodies and wall. No probe trajectory appears, consistent with reported close-contact use.

D-2, 19:53:17.500: The field rotates downward. A narrow region of floor enters view; hand placement and contact location remain hidden.

D-3, 19:53:19.000: Concrete and lower rail occupy more of the frame. The bodies remain close. The panel shows descent but cannot assign the cause of each movement.

D-4, 19:53:20.500: Vega is partly visible entering from the side. Her arrival does not expose Ellison's hands on Rusk's recording.

D-5, 19:53:21.000: The electrical sound ends. The frame remains materially obstructed. Ellison's vocalization is an audio fact rather than a visible hand fact.

D-6, 19:53:22.000: The view clears enough to show Ellison at floor level and Vega moving toward hand control. This time ends the certified obstruction.

Sequence D establishes the timing of one audible cycle and a descent. It cannot establish the factual predicate Rusk asserts for activation. The first cleared frame is an aftermath image and cannot reveal whether a strike or reach occurred seconds earlier. It likewise cannot prove that only nonthreatening pulling occurred.

Sequence E — restraint completion and method certification

E-1, 19:53:23: Vega approaches Ellison’s right side. Rusk maintains control opposite her. One forearm appears intermittently, but bodies still block portions of the wrists.

E-2, 19:53:29: Vega’s hands and part of Ellison’s right forearm are visible. The transcript records commands directed to hand positioning.

E-3, 19:53:33: A cuff ratchet is audible. The relevant metal and second wrist are partly obscured.

E-4, 19:53:37: The positions stabilize after Rusk announces the cuffs are on. No further energy-device activation follows.

The selected panels were generated from the certified fictional working copy without inserting or deleting intermediate frames. Brightness and contrast were not altered for the descriptive map. Time labels were placed outside the frame area so they do not cover evidence. The exhibit does not claim pixel-level measurement of body geometry, and it uses no generative reconstruction.

The map’s descriptive conclusion is limited. The camera shows initially empty hands, Rusk’s wrist grasp, body rotation, onset of obstruction, one cycle’s timing, descent, and postcycle hand control. It does not provide a reliable visual answer to the contested strike, equipment reach, or character of pulling during 19:53:08–19:53:22.

This time map is synthetic and was prepared only for the invented civil record. It offers no legal conclusion.
