

Synchronized Camera-Audio and Dispatch Comparison

Prepared: December 12, 2025 **Compared sources:** welfare-call audio, CAD event, Rusk camera, Vega camera, and device event time

This fictional comparison places independently maintained time streams on one reference clock. It answers sequence questions, not disputed hand-placement questions. Synchronization does not create content absent from every source. In particular, it cannot reveal whether Ellison struck Rusk's forearm, reached toward his duty belt, or only recoiled and pulled from a painful wrist grip.

The dispatch clock supplies the reference. Common radio transmissions audible on both cameras provide alignment markers. The body-camera display offsets were applied uniformly to their full recordings. The conducted-energy event time was compared to the continuous electrical sound and matched within the displayed second. No audio was stretched, reordered, or combined into a new conversation.

For whole-second chronology, the material alignment is stable: call received 19:42:11; officers dispatched 19:47:36; Rusk arrival 19:52:14; first contact 19:52:48; wrist grasp 19:53:02; critical visual obstruction 19:53:08–19:53:22; one cycle 19:53:16–19:53:21; view clearing 19:53:22; handcuffing complete 19:53:37. Subsecond uncertainty does not alter that order.

The sources and all recorded people are inventions. The method description is included so later users can test exactly what synchronization supports and where it stops.

Call and dispatch alignment

The emergency-call recording opens at 19:42:11. Iris identifies Larkspur Court and describes a medication or mental-health concern. At 19:43:34 she reports seeing no weapon, and at 19:46:00 she repeats that none is known. Those statements populate the CAD safety field. They establish information communicated before police contact, not omniscient knowledge of all objects.

The CAD assigns Rusk and Vega at 19:47:36. Their radio acknowledgments occur at 19:48:02 and 19:48:11. Both cameras later record routine channel traffic consistent with that event. No dispatch update adds an assault, crime, weapon, flight, or threat before arrival.

Rusk's arrival status is logged at 19:52:14, matching his vehicle-exit sequence. Vega's arrival follows at 19:52:31. Iris's parking-lot statement appears on Vega's recording and overlaps the period when Rusk proceeds toward Building C. The sources agree that Iris remains away from the breezeway.

This alignment confirms a protective, noncriminal starting context and initially reported absence of a weapon. It does not prevent officers from responding to later observed behavior. The comparison therefore separates "information known before contact" from "conduct asserted during contact" rather than treating one as proof of the other.

Contact and pre-obstruction sequence

Both cameras place first direct exchange at 19:52:48. Ellison's initial words and Rusk's explanation can be matched without material drift. The images show Ellison seated and empty-handed at first view. Vega remains behind Rusk, which explains why her recording gives broader context but a less direct contact angle.

At 19:53:01, Rusk instructs Ellison to stand and keep her hands visible. At 19:53:02, his camera shows the wrist grasp. Vega's view shows his forward movement but partly loses the contact behind his arm. The parties agree for procedural purposes that physical restraint and seizure begin then.

From 19:53:03 through 19:53:07, the audio contains Ellison objecting, Rusk requesting the other hand, Ellison reporting pain, and Rusk telling her to stop pulling. Video shows rotation and closing bodies. No source clearly shows a forearm strike or belt reach during those last pre-obstruction seconds.

At 19:53:08, the Rusk image crosses the defined material-obstruction threshold. Vega's angle is also blocked by Rusk and the breezeway structure. The alignment fixes when visibility is lost; it does not classify the movement that follows.

Critical interval comparison

Reference time	Synchronized content	Permitted descriptive conclusion
19:53:08–10	Close movement; both hand views unreliable	Obstruction and physical contact begin; hand action unresolved
19:53:11	Rusk says “stop pulling”; Ellison says “you’re hurting me”	Pulling is alleged and pain is reported; direction and danger remain unresolved
19:53:12	Dull contact sound; no source view	Sound source cannot be identified as strike, rail, foot, or body contact
19:53:14–15	Overlapping direction and movement; Rusk says “stay off it”	The pronoun has no visible referent; no belt contact can be certified
19:53:16	Continuous device sound begins; Ellison cries out	One drive-stun cycle starts during descent
19:53:17–20	Rotation and lowering; Vega approaches	Movement continues; neither camera reveals decisive hands
19:53:21	Device sound ends after about five seconds	Only cycle ends; justification is not established by sound
19:53:22	Rusk view clears; Ellison is down; Vega moves to a hand	Aftermath becomes visible; prior acts cannot be reverse-inferred

The table intentionally contains no row labeled “strike,” “reach,” “passive,” or “threat.” Those remain competing testimony rather than synchronized media facts.

Postcycle sequence and certification

From 19:53:23 through 19:53:37, the recordings show Vega and Rusk obtaining hand control and completing handcuffing. Cuff sounds and the officers' announcements align. No additional energy sound appears. Ellison reports shoulder, wrist, and burning pain before medical arrival. At 19:53:51, Rusk requests medical assistance for one drive-stun exposure.

The CAD entries follow the radio traffic: subject restrained, medical requested, supervisor advised, and later transport to Alder Creek Regional Medical Center. No arrest or recovered-weapon entry appears. At 19:54:02, Ellison denies trying to take equipment and says she pulled because the grip hurt. Her statement is synchronized but remains a party account.

The preparer certifies that the comparison retains each source's content and applies only constant clock offsets. There is no detected gap, deletion, or duplicated interval. Continuity supports the completeness of the fictional media while leaving the physical obstruction intact. Audio cannot be rendered as a picture, and two limited camera views cannot be fused into an unrecorded vantage.

This December 12 exhibit is a demonstrative in the synthetic civil case. It does not replace the original source records, authenticate a real dispatch system, or decide force, immunity, credibility, medical causation, or appellate jurisdiction. Its only claim is the stated event order and the limits of what synchronized sources reveal.
