FILING OR CYBERSECURITY GUIDE**

Declaration of DOE FOIA Officer on Request Processing

Filed: August 4, 2025 **Synthetic docket:** SYN-DMD-25-CV-0914

I, Elian Voss, declare under penalty of perjury that the following is true within this fictional exercise. I am the FOIA officer assigned to ORER. My exercise duties covered intake, scope confirmation, search coordination, exemption review, and production accounting.

I rely on my participation in request DOE-FOIA-2024-OG-041, the processing file, and information from custodians of the synthetic repositories. The attached public Vaughn index reflects the initial review. Its sealed counterpart uses inert fictional values where the public version displays redaction tokens.

Intake and Clarification History

ORER received Open Grid's request on June 3, 2024, and assigned DOE-FOIA-2024-OG-041 on June 10. The original language reached final and superseded Grid Sentinel playbooks plus final governance material. Our acknowledgment asked whether duplicate copies, final exercise editions, quality-review maps, and routine correspondence were included.

Open Grid proposed narrowing on June 14. ORER sent a confirmation question on June 18, and the requester gave final confirmation on June 21. The perfected boundary retained approved editions effective at any time from January 1, 2022, through May 31, 2024. It included an approved exercise edition and finalized quality-review map, deduplicated identical content, and limited correspondence to final approval or supersession instruments.

The agreement excluded drafts, comments, routine messages, actual incident material, telemetry, configurations, code, credentials, access data, real-infrastructure diagrams, and personal contact fields. I recorded that boundary in CLR-OG-0621. I did not treat any excluded category as collected and then exempt; it was outside the search universe.

Preservation notices were sent to Ari Tern and Milo Crest for likely authoritative versions and unique governance records. Those notices required no interaction with a live network.

Search Coordination and Review Stages

Custodians were assigned June 24, and the repository work began June 25. The fictional Beacon final-policy library, Driftglass superseded-version archive, and Harborline correspondence store were selected because records personnel identified them as the locations reasonably likely to contain the agreed material. Exports were complete July 2.

Dalen Saye applied content and metadata deduplication by July 12. The process reduced 16,842 raw hits to 1,284 candidate files. Automated filtering did not make the final responsiveness decision. Custodians examined forty-six candidates with a plausible finality and date match, separating authoritative records from drafts, duplicates, routine transmittals, and out-of-period files.

Twelve records comprising 200 logical pages were confirmed responsive. Substantive review began July 22 and ended August 12. I coordinated the production manifest and checked the disposition totals against the source-page counts. On August 16, I transmitted decision RLS-OG-001 and 146 produced page images.

I did not count later litigation copies as additional responsive records. A public and sealed court filing may reproduce one source excerpt twice for access purposes, but it remains one underlying agency record in the FOIA accounting.

Record and Page Accounting

By family, the responsive set assigns sixty pages to four decision-tree records. Three escalation-matrix records account for fifty-four pages; three coordination appendices account for sixty-four; and the two governance records account for twenty-two. The public index provides each identifier and individual length.

GS-DT-4.2, GS-DT-3.7, and GS-EM-4.2 were withheld in full. Their respective lengths are eighteen, sixteen, and twenty pages, for fifty-four pages. Seven other playbook records, totaling 124 pages, were released with redactions. GS-GV-04 and GS-GV-03, totaling twenty-two pages, were released without redaction. These figures sum to twelve records and 200 pages.

The 146 produced images consist of all 124 pages from partially released records and the twenty-two fully released governance pages. Sixty-eight images contain no visible blackout. Seventy-eight contain at least one. Among the latter, sixty-two reference 7(E), fifty-one reference 7(F), and thirty-five reference both; inclusion in more than one category does not add another physical page.

Every fully withheld page relies on 7(E), and thirty-nine also rely on 7(F). The counts describe page disposition, not the number of words removed.

Review Under Exemption 7(E)

I consulted Kira Morrow about how the approved documents were compiled and used. Based on that consultation, ORER concluded that the playbooks support prevention, recognition, and coordinated response to unlawful attacks in the fictional program. The conclusion depends on record purpose, not merely the office that stores them.

Reviewers marked nonpublic decision conditions, the order of fictional response choices, implementation relationships, and conditional branches. Where a field was treated as a guideline rather than a technique or procedure, the reviewer also considered whether disclosure could permit a person to anticipate or avoid the response framework. The public index identifies those functional types without stating their content.

I assessed foreseeable harm by asking whether disclosure would expose how the approved framework applies a general preparedness concept. A general technique can be publicly familiar while its particular implementation remains nonpublic. Comparison of current and superseded editions also can expose what condition or relationship changed.

The governance records did not contain this organization and were released. In partially released playbooks, reviewers preserved general context when they concluded that it did not reveal a protected relationship. Full withholding was used where the office viewed structure and operational detail as interdependent.

Review Under Exemption 7(F)

The processing team used four 7(F) labels: duty role, contact channel, safety reference, and escalation position. No real name, contact detail, or facility appears in this exercise collection. The labels describe the type of fictional field the office considered capable of directing interference toward people performing protective functions.

For each responsive playbook, a custodian identified whether one of those field types appeared and whether its placement gave it safety-related meaning. The public explanation states the category but does not reproduce the placement or associated operational context. The sealed index adds inert examples, such as Role-Dovetail and Safety-Echo, solely to preserve the review distinction without encoding an actual instruction.

I determined that disclosure could reasonably be expected to increase the opportunity to disrupt a response or focus attention on a safety function. I did not identify a threatened individual by name. Where the same field also disclosed sequence or implementation, reviewers marked both 7(E) and 7(F).

The determination applies this rationale consistently across category members. It does not provide a separate public narrative for every blackout because ORER believed the repeated functional description and confidential context were sufficient.

Segregability and Foreseeable-Harm Process

Reviewers examined each of the 200 source pages. They were instructed to retain a title, version marker, date, approval entry, general purpose sentence, and administrative heading when the item could be understood without revealing protected content. They also were instructed not to leave fragments that would disclose the relationship between two removed fields.

The review produced two fully released records and seven partially released records. For three records, reviewers concluded that the operational arrangement persisted across the document and that extracting isolated words would either be meaningless or reveal protected structure. I accepted those conclusions after comparing the proposed dispositions with the custodian descriptions.

Foreseeable harm was recorded by exemption category. For 7(E), the predicted harm was circumvention or reduced effectiveness through reconstruction of conditions and ordering. For 7(F), the predicted harm was interference with people associated with a fictional protective function. I concluded that no additional meaningful nonexempt text could be separated from the material then withheld.

The processing worksheet does not contain a public sentence for every line. It records page disposition, applicable category, and reviewer confirmation. The later public and sealed indexes translate that worksheet into record descriptions.

Administrative Appeal and Litigation Record

Open Grid appealed on August 30, 2024. I assembled the request, clarification, search summary, decision, manifest, production, withheld-record descriptions, and a confidential component statement. The appeal office accepted the matter September 6 and issued final decision FAD-OG-1007 on October 7.

The final decision affirmed the law-enforcement-purpose determination, 7(E) analysis, 7(F) categories, foreseeable-harm findings, and segregation conclusion. It did not change the twelve-record universe or order another production. The administrative file was preserved after final action and later transferred to fictional government counsel for this case.

In preparing for litigation, I rechecked the arithmetic and confirmed that it counts underlying source pages once. I also worked with the custodian and search declarants to ensure that the public index, sealed counterpart, and declarations use consistent identifiers. The sealed version does not supply real cyber information; its values are deliberately inert.

I understand that the Court will decide whether our explanations and evidence meet DOE's burden. My declaration describes what the component did and why. It does not offer a legal conclusion binding on the Court or claim that production volume alone proves segregability.

Verification

I reviewed the June correspondence, the search log, the responsive-record schedule, the review worksheet, RLS-OG-001, the appeal file, and the public and sealed indexes before signing. The dates, identifiers, and arithmetic in this declaration agree with those materials. The responsive count remains twelve records and 200 logical pages.

I also verified that the public index replaces the inert synthetic values used in its sealed counterpart with visible redaction notices. Each corresponding index page addresses the same record group, although wording differs. That one-to-one organization permits a stable logical reference without revealing a sealed physical location to an unauthorized viewer.

Nothing in my declaration instructs a reader how to detect, exploit, or respond to a real cyber event. Grid Sentinel, the repositories, the record values, and every person named here are fictional. The declaration is evidence only within the synthetic case identified above.

I declare under penalty of perjury that the foregoing is true and correct within this exercise record. Executed on August 4, 2025.

Elian Voss Fictional DOE FOIA Officer
