AGENCIES, SYSTEMS, IDENTIFIERS, AND EVENTS — NOT A REAL
FILING OR CYBERSECURITY GUIDE**

Public Redacted Supplemental Vaughn Index

Filed: September 8, 2025 **Synthetic docket:** SYN-DMD-25-CV-0914 **Production:** RLS-OG-002 **Access:** Public counterpart

This supplement records the targeted re-search and renewed segregation review completed after the primary index. It does not replace the twelve record descriptions or alter their source lengths. Instead, it gives narrower functional labels, identifies the records receiving additional text, and explains why ORER retained the remaining redactions.

No additional responsive final record was located. The collection still contains twelve items and 200 logical pages. Three records totaling fifty-four pages remain withheld in full; seven totaling 124 pages remain partial; two totaling twenty-two pages remain fully released. Eleven replacement images within the existing 146-image production disclose seventeen additional passages.

The public tokens keep the same meaning established in the primary index. They identify a fictional field type without revealing any value. A controlled counterpart follows this seven-page semantic order and uses only inert exercise labels. Neither version contains a usable cyber technique or genuine personnel information.

Re-Search and Inventory Confirmation

ORER reran suite-name and family-name queries on the frozen Beacon, Driftglass, and Harborline exports. It also traced predecessor and replacement fields for each retained edition and cross-checked the final governance instruments. The process returned no omitted authoritative record.

Custodians confirmed that no new ordinary repository had been identified. Results outside the twelve-record set were classified as duplicates, drafts, routine transmittals, or outside the effective-date range. The exercise search never extended to incident information, a live system, or any category excluded in the June 2024 clarification.

The original family arithmetic remains sixty decision-tree pages, fifty-four escalation-matrix pages, sixty-four coordination-appendix pages, and twenty-two governance pages. The fact that eleven page images were replaced does not increase any subtotal, because each image corresponds to a page produced previously.

This supplement therefore addresses specificity rather than collection completeness. Record identifiers, effective dates, and initial dispositions remain those listed in the primary public index. Updated entries below state where added text was released and which functional grounds continue to be asserted.

Segment-by-Segment Review Method

Each withheld segment was tested for independent administrative meaning. Reviewers asked whether visible text could stand without a protected value, whether placement would expose the relationship between omitted fields, whether a heading remained useful after subordinate content was removed, and whether a harmless descriptor could be separated from a contact or safety field.

The worksheet used stable semantic segments. A public reviewer sees notices such as [REDACTED—FICTIONAL DECISION CONDITION] or [REDACTED—FICTIONAL DUTY ROLE], never a raw controlled-page location. Proposed release text was read with surrounding visible language to avoid accidentally reconstructing an asserted order.

For 7(E), retained segments were divided into condition, ordering, implementation-relationship, or guideline-value types. Guideline entries include a circumvention prediction. For 7(F), the retained types remain role, channel, safety reference, and escalation position. A segment may carry both exemptions when the office says it reveals both response organization and a human protective function.

The method yielded seventeen passages over eleven images. Six images gained two passages, and five gained one. No wholly withheld record changed disposition.

Decision-Record Updates

GS-DT-T1 received three additional passages across two replacement images. One image now shows a neutral review heading and a document-owner statement; another shows general exercise-recordkeeping language. The remaining blackouts concern [REDACTED—FICTIONAL DECISION CONDITION], [REDACTED—FICTIONAL RESPONSE ORDER], and limited role or channel fields.

GS-DT-QA likewise received three passages on two images. Newly visible text identifies quality-review status, distinguishes approval from draft review, and explains that the map records consistency findings. OREER retains comparison-sensitive relationships that it says would disclose how the current tree applies an abstract condition.

For both records, the agency invokes 7(E) only where it continues to identify a nonpublic condition, relative order, or comparison relationship. It invokes 7(F) for a smaller group of fictional human-function fields. The public explanation does not disclose their values.

GS-DT-4.2 and GS-DT-3.7 remain withheld in full. Reviewers again concluded that their operational arrangement is continuous and that detached words would expose relational structure or lack independent meaning. The supplement adds no passage from either record.

Escalation-Matrix Updates

GS-EM-T1 received three passages on two replacement images. The added text consists of a neutral classification heading, a sentence describing exercise documentation, and a revision-control statement. Other cells continue to display notices for fictional escalation values, duty roles, safety references, or contact channels.

GS-EM-3.7 remains partially released but received no new text. The team concluded that its remaining blocked cells communicate either a classification relationship under 7(E) or a human protective assignment under 7(F). GS-EM-4.2 remains withheld in full because ORER views the current matrix's arrangement as integrated across its twenty pages.

The agency's revised description links each matrix segment to a functional label. For an escalation guideline, it predicts that revealing the actual value could enable anticipation of when the framework changes classification. For role, channel, and safety fields, it predicts interference with people engaged in the fictional response.

Those 7(F) predictions remain category-level. The index identifies no actual person and does not state a separate threat scenario for each cell. The additional specificity lies in page-segment correlation and field type, not a new causal theory.

Coordination-Appendix Updates and Release Count

GS-CA-4.2 received five passages across three replacement images. Two images gained two passages apiece, and one gained a single passage. The new text covers an administrative ownership sentence, two general coordination statements, a closure-record instruction, and a revision note.

GS-CA-3.7 received three passages on two images: a neutral section heading, a recordkeeping direction, and general prose that does not identify a fictional assignment. GS-CA-T1 received no further text after contextual review. Remaining notices identify ordering relationships under 7(E) or role, channel, and safety fields under 7(F).

The record allocation reconciles exactly. Decision materials gained six passages on four images; the exercise matrix gained three on two; the current appendix gained five on three; and the prior appendix gained three on two. Those figures total seventeen passages and eleven images. Six images carry two releases each, while five images carry one each.

Nothing was added from a fully withheld record or the already complete governance records. All replacement images preserve their original source pagination and earlier visible content.

Supplemental Position and Certification

ORER maintains that the remaining 7(E) segments disclose nonpublic conditions, ordering, implementation relationships, or guideline values. It maintains that disclosure of the remaining 7(F) segments could facilitate interference with a fictional protective human function. Where two exemptions overlap, the supplemental worksheet records both rather than treating one as a substitute for the other.

After the seventeen-passage release, reviewers again concluded that no further meaningful nonexempt portion could be separated. Their conclusion relies on contextual segment review and custodian confirmation. It does not rely solely on the number of pages already produced.

This public supplement corresponds by semantic page to a sealed exercise copy. Controlled values are replaced here by conspicuous category notices. Stable references can resolve to the public segment without exposing a sealed page identity or metadata.

I, Elian Voss, certify that the re-search, passage counts, and updated record descriptions are accurate within this synthetic file. The materials contain no real system details, locations, contacts, or instructions. Executed September 8, 2025.
