

Body-Camera Custodian Declaration and Export Log

I, fictional Sergeant Lila Grant, declare that I am the Alder Creek Police Department digital-evidence custodian for this exercise. My ordinary duties include device assignment records, automated upload review, access auditing, native export, working-copy creation, and certification. I make this declaration from the simulated evidence-system records. It was filed on the invented civil docket on November 21, 2025.

The department assigned camera ACPD-BWC-214 to Officer Nolan Rusk and ACPD-BWC-236 to Officer Priya Vega on February 3, 2025. Both devices passed start-of-shift status checks. Their clocks received the department time service. Each device created a continuous event file associated with welfare event ACPD-2025-0203-194211-WC.

The files uploaded through the evidence dock after the incident. System records show no user deletion, trim, mute operation, or content replacement. Routine metadata additions—event number, officer name, and retention category—did not alter audiovisual essence. The cameras' physical viewpoints differ, and their authentic continuity does not guarantee that a hand remained visible.

This declaration addresses chain, identifiers, exports, and integrity. It does not interpret body movement, assess credibility, identify a threat, or opine on constitutional reasonableness. All systems, recordings, and actors described are fictional.

Acquisition and access history

Rusk's device began the relevant event before his recorded 19:52:14 arrival and continued through medical staging. Vega's device began before her 19:52:31 arrival and likewise continued beyond restraint. The evidence service received both native containers during the officers' postincident upload process. Automated validation reported complete container structure and playable media.

Initial access was limited to the uploading officers, Lieutenant Marcus Hale for force review, and digital-evidence staff. Viewing events were logged without changing source bytes. Rusk and Vega could add incident metadata but could not overwrite the retained native object. Hale viewed both recordings on February 4. I reviewed integrity and retention fields on February 5.

Civil preservation was applied after notice of Ellison's claim. On May 14, I confirmed that the two native containers remained under the same object identifiers. Discovery counsel later requested certified working copies. I made exports rather than supplying credentials to the evidence system. Every export event produced an audit entry and verification value.

The native files contain no fourteen-second deletion at the pivotal time. Rusk's image is physically blocked from 19:53:08 through 19:53:22 while audio continues. Vega's file also continues but does not reliably depict Ellison's hands from its angle. Those are content limitations, not custody gaps.

Rusk-file export entries

Native object: ACPD-BWC-214-20250203-195203.native **Assigned officer:** Nolan Rusk

Event link: ACPD-2025-0203-194211-WC **Evidence-system verification:**

92c5501a9ff2cd953c6df5843a9974a2d49511e8a1c71d057a487c8a748cbced

On November 14, 2025, I exported a read-only audiovisual working copy for transcript and frame preparation. The evidence application decoded the native container without cropping or content enhancement. I retained the original audio channels and display-time metadata. The resulting working-copy verification was

43cfa774436d461f50704327665aa205822c17d75a295a98de0c3e1915707229.

I compared the working copy's duration, beginning and ending content, internal time progression, and event-system verification report with the native object. The checks matched. I then placed the copy in the fictional litigation-production directory with read-only permissions. The certified transcript and time map identify this working copy as their source.

The two verification strings authenticate synthetic evidence-system objects within the authored story. They are not hashes of any rendered court PDF, record manifest, optional bundled video, or future archive. If the repository later includes separate media bytes, their actual digests must be computed from those bytes rather than inferred from this declaration.

Vega-file export entries

Native object: ACPD-BWC-236-20250203-195219.native **Assigned officer:** Priya Vega **Event link:** ACPD-2025-0203-194211-WC **Evidence-system verification:**
b7fd169f33340b14e1100fd9c8fc1575c56c3c79ec0b1cfb5407fc1c0787c07e

I created Vega's read-only working copy through the same November 14 export process. Its verification value was

9bdbd9c8d69a6a6aaf8db738fe50074f149c48b222b6b8c3f3f0b47931b7b846. Duration, continuous time progression, first and last event content, and audio-channel presence matched the evidence report.

Vega's different starting time does not indicate missing material. She activated before her own arrival, later than Rusk's source identifier, and her recording includes the encounter beginning before physical restraint. Common radio and dialogue cues permit synchronization. The certified comparison records any applied constant offset.

No export setting created a clearer view of hidden hands. Container decoding can present recorded pixels but cannot see around Rusk's body, the support, or the rail. I made no generated frame, motion interpolation, object replacement, or audio reconstruction. Descriptive annotations were added only in separate exhibits and do not modify this working copy.

The verification identifiers here belong solely to the fictional evidence narrative. They do not assert external authenticity or reproducible PDF output.

Certification, production boundary, and limits

I certify that the fictional native objects and November 14 working copies maintain the chain described above. The source recordings are continuous across the material contact. The associated transcript, frame map, second-camera transcript, synchronized comparison, and annotated occlusion exhibit can be checked against those working copies. Any difference in descriptive wording should be resolved by the source media rather than by assuming one derivative is conclusive.

My certification does not establish the truth of Rusk's report that Ellison struck his forearm and reached toward his belt. It also does not establish Ellison's denial. The recordings preserve initial empty hands, the wrist grasp, close movement, obstruction, one cycle's audio, descent, hand control, and pain complaints. Their inability to resolve the contested hands is an authenticated evidentiary limit.

The native and working-copy verification values are not repository asset promises. The fictional case may ship without a root-owned video, because the transcript and frame-analysis PDFs constitute the counted record. Any optional media must receive its own manifest digest, access treatment, and review. This declaration cannot pre-certify bytes not examined.

I sign under the exercise's declaration convention on November 21, 2025. Alder Creek Police Department, its evidence platform, and every identified object are inventions. The document is not a declaration made to an actual court, does not authenticate real police media, and supplies no legal or technical advice for another case.
