

March 4 opening calibration

Participants were Draven Pike, Mira Solis, Naomi Voss, and Sable Finch. Finch restated the \$612,000 target; Solis reviewed the anti-retaliation flag and instructed participants not to use protected activity as a criterion.

The group examined the four-manager baseline. Pike asked whether Benton's Northline and Oriole transitions required her through June. Voss said the work was significant but could be handed off. Pike asked whether Keene's automation tools and Ibarra's travel availability were difficult to replace.

Solis recorded that scoring changes required source notes. No employee was selected at this meeting.

March 7 score-adjustment session

Voss proposed reducing Benton's continuity from 22 to 14 because Wynn could receive Northline and Ibarra could receive Oriole. She also proposed reducing availability from 12 to 6 based on the December short-notice decline. Solis asked whether completed travel supported the size of the change.

Pike approved both edits, stating that the model should reflect forward coverage rather than historical volume. The minutes do not show the same forward-looking approach applied to Wynn's May transition or Benton's ongoing client work.

Finch reported that a Benton-selection scenario would exceed the target without another manager change. Alternative consolidation scenarios remained open.

March 10 comparator exceptions

The team increased Wynn's continuity score to 22 for Lantern and Ibarra's availability score to 14 for offered future travel. Solis flagged that Lantern ended before Benton's two transitions and that Ibarra's completed travel was below Benton's.

Pike responded that client sensitivity and expected summer demand supported the exceptions. He asked Solis to retain the source notes. Keene's automation credit remained under review because the library was accessible to the manager group.

The minutes identify no complaint-related statement. They do show that different evidence and time horizons were used in adjustments favoring retained employees.

March 14 final calibration meeting

Solis reduced Benton's uniqueness score from 9 to 7 after the group concluded her remediation review could be divided among Keene and Voss. Keene's uniqueness increased from 14 to 15 because leadership wanted one owner for the automation library.

Final totals were Benton 68, Wynn 78, Ibarra 78, and Keene 75. The group reviewed four qualifying savings scenarios. Pike favored the Benton scenario, citing salary savings and the asserted ease of redistributing her functions.

Finch deferred final finance confirmation to March 18. Solis requested a written response to the three consistency variances before approval.

Version log and action disposition

Meeting-linked versions are 03-04-CAL, 03-07-CAL, 03-10-CAL, and 03-14-CAL. Each preserves the prior scores. Finch confirmed scenario arithmetic on March 18. Pike initialed the variance audit and approved version 03-21-FINAL on March 21.

Open actions closed as follows: Wynn continuity—approved; Ibarra travel—approved; Keene automation—approved; Benton continuity and availability reductions—approved; Benton uniqueness reduction—approved. The only cited umbrella explanation was “business continuity.”

The minutes contain no vote and give Pike final authority. Solis maintained the record but did not independently choose the selected employee.
